

Save Money (And The Planet):

Stop Server Sprawl

When MGA Insurance found themselves with a room full of sixteen inefficient, obsolete servers, they knew they had to do something about it quickly. After all, old servers don't just slow down network performance: they also increase the likelihood of a catastrophic data loss.

So when IT Director Chuck Wolbert called SouthTech Solutions, they immediately recommended virtualization. That way, MGA could run multiple workloads on one piece of hardware with no conflicts.

That means better performance, lower energy costs, and better data protection now, as well as lower replacement costs in the future.

No more server sprawl. No more flirting with data disaster. And no more wasting money. All thanks to SouthTech.

"You can buy equipment anywhere," Chuck adds. "It's the quality of service and the depth of knowledge SouthTech exhibits that built our confidence in their people."
